

## ABSTRACT

The box-assembly device (100) includes a first locking part (10) and a second locking part (20). The first locking part (10) is open at two faces thereof, thus being fitted over an edge of a panel (P) around a corner of a box. The second locking part (20) is integrated with an end of the first locking part (10) into a single body, and is open at two faces thereof, thus being fitted over an edge of another panel (P) around the corner of the box. The first and second locking parts (10, 20) are open in the same direction.
